$$G_{\sigma}(s_{i}k) = \sum_{j} l_{j}exp(-\frac{dist(b_{i}, b_{j})}{(2\sigma^{2})})(s_{j})^{k}$$

where

- $l_j \in \mathbb{R}$:the length of bj
- $dist \in \mathbb{R}^n, \mathbb{R}^n \to \mathbb{R}$: measures the geodesic distance between the centers of bi and bj along the boundary
- $\sigma \in \mathbb{R}$
- $b_i \in \mathbb{R}^n$
- $b_j \in \mathbb{R}^n$
- $s_j \in \mathbb{R}$:unit direction vector of bi
- $k \in \mathbb{R}$:iteration number
